## List of exercises \#2-7600037

1. Cohen-Tannoudji, exercises 2 and 3 from chapter IX (complement B).
2. Cohen-Tannoudji, exercises 1 to 5 (except 2 which is optional) from chapter X (complement G ).
3. Cohen-Tannoudji, complement A from chapter IX.
(a) Show that the operator $e^{-i \boldsymbol{\sigma} \cdot \hat{n} \phi / 2}=\mathbb{I} \cos \left(\frac{\phi}{2}\right)-i \boldsymbol{\sigma} \cdot \hat{n} \sin \left(\frac{\phi}{2}\right)$, where $\boldsymbol{\sigma}$ are the Pauli matrices, $\hat{n}$ is a unit vector, and $\phi \in \Re$.
(b) What is the physical interpretation of the operator in the previous item? What is the significance for $\phi=2 \pi$ ?
4. (Optional) Cohen-Tannoudji, complement D from chapter X.
5. Let $\mathbf{J}$ be the total angular momentum of a physical system.
(a) Compute $\mathbf{J}^{\prime}=e^{-\frac{i}{\hbar} \phi J_{z}} \mathbf{J} e^{\frac{i}{\hbar} \phi J_{z}}$. (Hint: Use the Baker-Haussdorff identity: $e^{X} Y e^{-X}=Y+[X, Y]+$ $\left.\frac{1}{2!}[X,[X, Y]]+\frac{1}{3!}[X,[X,[X, Y]]]+\ldots.\right)$
(b) Interpret geometrically your result for $\mathbf{J}^{\prime}$.
(c) Based on this interpretation, what would be the result for $\mathbf{J}^{\prime \prime}=e^{-\frac{i}{\hbar} \phi \hat{n} \cdot \mathbf{J}} \mathbf{J} e^{\frac{i}{\hbar} \phi \hat{n} \cdot \mathbf{J}}$, where $\hat{n}$ is a unitary vector?
(d) And for $\mathbf{J}^{\prime \prime \prime}=e^{-\frac{i}{\hbar} \theta J_{x}} e^{-\frac{i}{\hbar} \phi J_{z}} \mathbf{J} e^{\frac{i}{\hbar} \phi J_{z}} e^{\frac{i}{\hbar} \theta J_{x}}$ ?
6. Show the identity used in class: $e^{-\frac{i}{\hbar} \mathbf{d} \cdot \mathbf{P}} \mathbf{R} e^{\frac{i}{\hbar} \mathbf{d} \cdot \mathbf{P}}=\mathbf{R}-\mathbf{d} \mathbb{I}$, where $\mathbf{d}$ is a vector, and $\mathbf{R}$ and $\mathbf{P}$ are the usual position and momentum operators, respectively.
7. Cohen-Tannoudji, complement F from chapter II.
(a) How does the momentum operator ( $\mathbf{p}$ ) transform under parity $(\boldsymbol{\pi})$ ?
(b) A quantum mechanical state $|\psi\rangle$ is known to be Eigenstate of momentum and parity simultaneously. What can be said about the eigenvalues?
(c) Give a physical interpretation of your results in the previous item.
8. Cohen-Tannoudji, complement B from chapter VII; and Shankar, Sec. 15.4.
(a) Show that the Runge-Lenz vector $\mathbf{N}=\mathbf{p} \times \mathbf{L}+\alpha \hat{r}$ is a conserved quantity for a central force $\mathbf{F}=F(r) \hat{r}$, with $F(r) \propto r^{-2}$.
(b) Compute $\alpha$ for the gravitational force.
(c) Using that the orbital angular momentum $\mathbf{L}$ and $\mathbf{N}$ are conserved, show the first law of Kepler.
(d) In quantum mechanics, it is useful to use the symmetrization rule $O \rightarrow \frac{1}{2}\left(O+O^{\dagger}\right)$. Using this rule, show that the Runge-Lenz vector operator is $\mathbf{N}=\frac{1}{2}(\mathbf{p} \times \mathbf{L}-\mathbf{L} \times \mathbf{p})+\alpha \hat{r}$.
(e) Show that $\mathbf{N}$ commutes with the Hydrogen atom Hamiltonian and compute $\alpha$. This additional symmetry is responsible for the larger degeneracy in the Hydrogen atom when compared with the 3D Harmonic Oscillator.
(f) What is the implication for the wavefunction $\Psi_{1,0,0}$ in exercise $7(\mathrm{~g})$ of List \#1?
